HIPAA

The Health Insurance Portability and Accountability Act of 1996 (HIPAA) impacts virtually every health-related organization in the U.S., including all health care providers (even one-physician offices), health plans, employers, public health authorities, hospitals, life insurers, clearinghouses, billing agencies, information systems vendors, service organizations, and universities. Part of this act is focused on the secure transmission and storage of confidential patient data. Non-compliance with these regulations can mean both civil and criminal penalties. To be HIPAA compliant, organizations must provide reasonable and appropriate administrative, technical, and physical safeguards to ensure integrity, confidentiality, and availability of patient information.

Under HIPAA, organizations must provide security and privacy for personal health information to guard against reasonably anticipated threats or hazards, both in transit and during storage. Physical safeguards and technical measures to protect patient information must also be in place as well. Rather than spending huge sums of money to bring their own IT departments within HIPAA compliance, users can utilize Enveloc to provide an economically feasible data security and storage solution without compromising patient privacy.

With Enveloc, patient data is secured using 256-bit AES encryption before it is transmitted to our servers residing at our secure class A Network Operation Centers. Physical access is strictly controlled through administrative procedures, physical safeguards, and technical security measures to prevent unauthorized use or disclosure of customer data. Access to data requires that designated personnel provide an authorized encryption passphrase (not even Enveloc has a copy), making unauthorized access virtually impossible.

HIPAA also mandates that healthcare providers retain electronic patient records for a minimum of 6 years and strictly forbids unauthorized access to individually identifiable health records. To accommodate, Enveloc provides a cost effective way to store patient data indefinitely in secured facilities, in encrypted lossless compression.

Enveloc features daily automatic backups scheduled by the user and backups can be restored to any location, 24/7. Our 'Always Live', US-based customer service is available around the clock and daily backup audits and confirmation e-mails with summary transfer logs ensure the integrity of every single data backup set to provide a clear audit trail, if necessary.

PRODUCT DESCRIPTIONS

network centers. The user may also select any locally attached drive to retain drive images at no additional cost.

Enveloc Pro: Enveloc Pro automatically backs up selected files and subsequent changes to Enveloc's geographically separate

Enveloc *LocalRemote* backs up, it keeps one copy of the encrypted data on the external storage device and sends a redundant copy of the encrypted data to the remote server. When the user needs to restore files, the backups are on the external storage device and can be accessed instantly. If the device is lost, stolen, or destroyed, the user can download the remote backups that are safely stored on the Enveloc server. The device may also be used to store drive images at no additional cost.

Enveloc LocalRemote: During installation, the user can select any locally attached drive as an external storage device. When

device used for the onsite storage. Multiple users on a network may use the same NAS device for their backups. Users may restore from the NAS device or download the backups, which are safely stored on the Enveloc server. The NAS device may also be used to store drive images from multiple machines at no additional cost.

Enveloc NASRemote: Enveloc *NASRemote* offers the same offsite protection as *LocalRemote*, with the ease of a network attached storage
